

AI-POWERED COMPETITIVE MONITORING

CASE STUDY

Mining hundreds of airline websites to
compare flight ticket fares

INTRO

The client is one of the leaders in the business intelligence segment.

They offer **competitive monitoring**, analytics and knowledge services to large enterprises across industries such as financial services, travel, hospitality and retail.

PROBLEM

Delivering robust competitive monitoring to one of their travel-tech customer was challenging. They needed to monitor 100s of airline websites with no uniformity in structure and navigation to continuously evaluate airline ticket fares.

Airline websites are dynamic in nature. They make frequent changes to their webpage layout. There are variations in critical data points such as fares, availability of flights, duration etc.

PAIN POINTS

- Relying on **site-specific scripts** for monitoring needs, did not serve the purpose. One configuration rarely fits two websites and easily breaks across different webpages.
- Creating and maintaining site-specific scripts composed of countless **rule engines** was very chaotic.
- Target websites were **blocking crawlers** incessantly, as soon as crawling began.
- Onboarding clients with a handful of new target websites took anywhere between **4 weeks to 6 weeks**.

Goal

Make monitoring across multiple websites easier, more accurate and block resistant.

Onboard new clients quickly, with minimal effort.

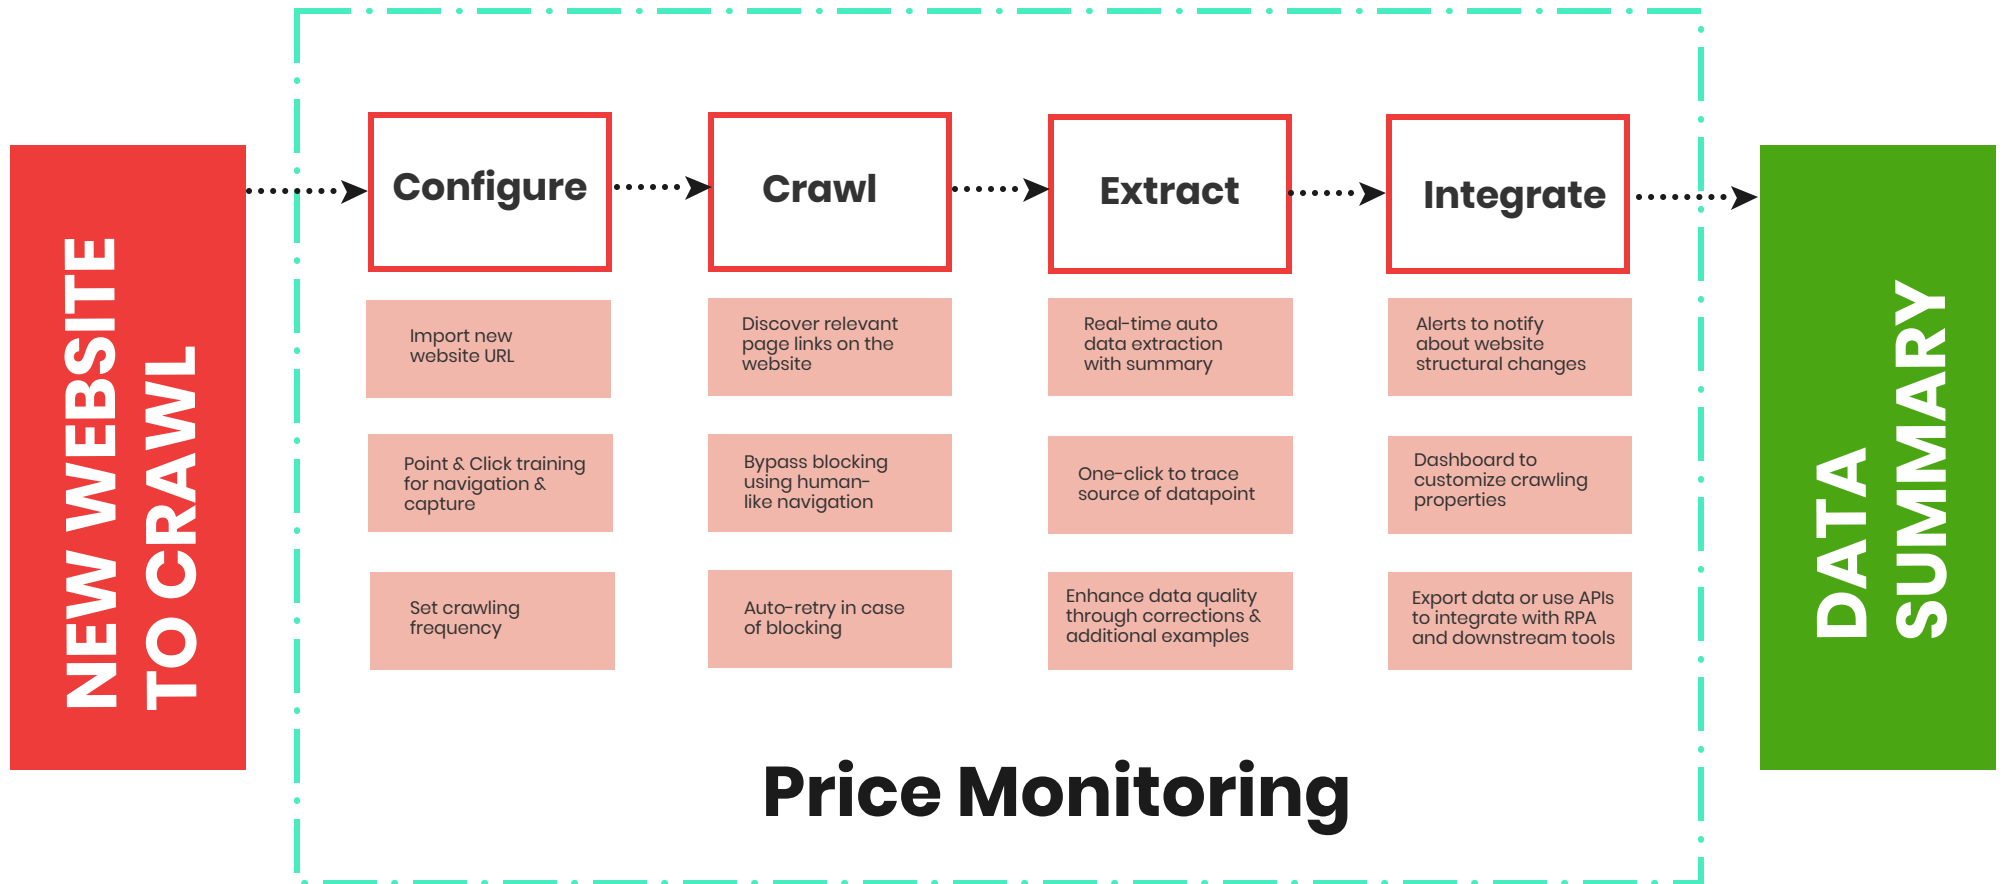

Botminds Solution Approach

- No code platform that requires only point and click activities to create intelligent crawlers.
- AI embedded intelligent browser handles destination site blocking by mimicking human navigation behavior.
- On-prem solution deployment for massive scale needs.
- Support for rapidly onboarding new clients.

Process Workflow

Competitive monitoring workflow for dynamic websites

Impactful Results

New destination websites onboarded **within days**, compared to prior solutions that took months.

One Botminds configuration to fit the crawling needs across multiple websites.

Scale on-demand to support more websites, hence more customers.

Key Metrics

Not months anymore.
Competitive monitoring in days.

Before Botminds

6 weeks for one airline website

IP blocked after crawling
ten times

Crawler failed to work when
website layout changed

After Botminds

1 day for one airline website

IP never gets blocked through
mimicking human navigation

Crawler recognizes changes
through AI based learning

Start
monitoring
your
competitor
websites
today
